Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously presented) In a data communication network supporting data compression, a method for optimizing compression efficiency, comprising:

filtering protocol-specific header and control information of a protocol data unit (PDU) to determine compressibility of the contents of said protocol data unit including determining if a given protocol data unit is associated with a previously filtered protocol data unit;

based on the result of said filtering, selecting the state of data link compression for said protocol data unit to optimize compression efficiency such that if the given protocol data unit is associated with a previously filtered protocol data unit, the data link compression for the previously filtered protocol data unit is selected; and

associating the selected state of data link compression with the protocol data unit to control a compression process adapted to compress contents of protocol data units.

2. (Original) The method as claimed in claim 1, further including

Applicant: Brooks et al. **Application No.:** 09/774,545

compressing the contents of the protocol data unit as a function of the state of data

link compression.

3. (Original) The method as claimed in claim 2, wherein compressing

the contents of the protocol data unit includes applying an indication in or with the

compressed protocol data unit to indicate whether the contents of the protocol data

unit have been compressed.

4. The method as claimed in claim 3, further including (Original)

decompressing the compressed contents of the protocol data unit.

5. (Original) The method as claimed in claim 4, wherein, based on the

indication of whether the contents of the protocol data unit have been compressed,

decompressing the compressed contents of the protocol data unit is performed in a

manner previously negotiated.

6. (Original) The method as claimed in claim 1, further including

accessing a table having entries with specific media types deemed compression

limited.

7. (Original) The method as claimed in claim 1, wherein filtering

- 3 -

Applicant: Brooks et al. **Application No.:** 09/774,545

includes associating individual protocol data units to a specific media type.

8. (Cancelled)

9. (Previously Presented) The method as claimed in claim 1, wherein

determining includes accessing a table including information of previously filtered

protocol data units.

10. (Original) The method as claimed in claim 1, wherein selecting the

state of the data link compression includes disabling the data link compression if

the compressibility of the contents of the protocol data unit is determined to be low.

11. (Original) The method as claimed in claim 1, wherein selecting the

state of the data link compression includes enabling the data link compression if the

compressibility of the contents of the protocol data unit is determined to be high.

12. (Original) The method as claimed in claim 1, further including

initializing a table used by the data link compression with data patterns expected to

be contained in the content of said protocol data unit.

13. (Currently Amended) In a data communication network supporting

- 4 -

Applicant: Brooks et al. **Application No.:** 09/774,545

Application No.:

data compression, an apparatus for optimizing compression efficiency, comprising:

a filter of protocol specific header and control information of a protocol data

unit (PDU) filter configured to determine compressibility of the contents of said a

given protocol data unit by including determining if the a given protocol data unit is

associated with a previously filtered protocol data unit; and

a selector coupled to the output of the filter and configured to (i) to select the

state of data link compression for the protocol data unit to optimize compression

efficiency such that if the given protocol data unit is associated with a previously

filtered protocol data unit, the data link compression for the previously filtered

protocol data unit is selected; and (ii) to associate the selected state of data link

compression with the protocol data unit to control a compressor adapted to

compress contents of protocol data units.

14. (Previously Amended) The apparatus as claimed in claim 13,

further including a compressor configured to compress the contents of the protocol

data unit responsive to the state of data link compression.

15. (Previously Amended) The apparatus as claimed in claim 14,

wherein the compressor is configured to include an indication in or with the

compressed protocol data unit to indicate whether the contents of the protocol data

unit have been compressed.

- 5 -

Applicant: Brooks et al. **Application No.:** 09/774,545

16. (Previously presented) The apparatus as claimed in claim 15,

further including a decompressor configured to decompress the compressed contents

of the protocol data unit.

17. (Previously presented) The apparatus as claimed in claim 16,

wherein, the decompressor is configured to decompress the contents of the protocol

data unit in a manner previously negotiated with the compressor based on the

indication of whether the contents of the protocol data unit have been compressed.

18. The apparatus according to claim 13, (Currently Amended)

wherein:

the filter is configured to determine compressibility of the contents of the

given protocol data unit by determining the type of data of the given protocol data

unit where the given protocol data unit is not associated with a previously filtered

protocol data unit; and

the selector is configured to select the state of data link compression for the

given protocol data unit based on the determined type of data of the given protocol

data unit if the given protocol data unit is not associated with a previously filtered

protocol data unit and includes a table configured to store entries with specific

media types deemed compression limited.

- 6 -

Applicant: Brooks et al. Application No.: 09/774,545

19. (Previously presented) The apparatus as claimed in claim 13,

wherein the filter is configured to associate individual protocol data units to a

specific media type.

20. (Previously presented)) The apparatus as claimed in claim 19,

wherein the filter further includes a tracking unit to determine if a given protocol

data unit is associated with a previously filtered protocol data unit.

21. (Previously presented)) The apparatus as claimed in claim 20,

wherein the filter further includes a table configured to store information of

previously filtered protocol data units.

22. (Previously presented)) The apparatus as claimed in claim 13,

wherein the selector is configured to disable the compressor if the compressibility of

the contents of the protocol data unit is determined to be low.

23. (Previously presented)) The apparatus as claimed in claim 13,

wherein the selector is configured to enable the compressor if the compressibility of

the contents of the protocol data unit is determined to be high.

- 7 -

- 24. (Previously presented)) The apparatus as claimed in claim 13, further including an initialization unit configured to initialize a table used by the compressor with data patterns expected to be contained in the content of said protocol data unit.
- 25. (Currently Amended) In a data communication network supporting data compression, an apparatus for optimizing compression efficiency, comprising:

means for filtering protocol-specific header and control information of a protocol data unit to determine compressibility of the contents of said protocol data units including:

means for determining if a given protocol data unit is associated with a previously filtered protocol data unit; and

means for determining the type of data of the given protocol data unit
where the given protocol data unit is not associated with a previously filtered
protocol data unit;

means for selecting the state of data link compression for said protocol data unit based on the results of said filtering to optimize compression efficiency such that:

if the given protocol data unit is associated with a previously filtered protocol data unit, the data link compression for the previously filtered protocol data unit is selected; and

otherwise the state of data link compression is selected based on the

determined type of data of the given protocol data unit; and

means for associating the selected state of data link compression with the

protocol data unit to control a compression process adapted to compress contents of

protocol data units.

26. (Original) The apparatus as claimed in claim 25, further including

means for compressing the contents of the protocol data unit based on the state of

data link compression.

27. (Original) The apparatus as claimed in claim 26, further including

means for decompressing the contents of the protocol data unit in a manner

previously negotiated with the compressor.

28. (Currently Amended) A computer-readable medium having stored

thereon sequences of instructions, the sequences of instructions including

instructions, when executed by a processor, configured to cause the processor to

perform:

filtering protocol-specific header and control information of a protocol data

unit to determine compressibility of the contents of said protocol data unit

including:

-9-

determining if a given protocol data unit is associated with a previously filtered protocol data unit; and

determining the type of data of the given protocol data unit where the given protocol data unit is not associated with a previously filtered protocol data unit;

selecting the state of data link compression for said protocol data unit based on the results of said filtering to optimize compression efficiency such that:

if the given protocol data unit is associated with a previously filtered protocol data unit, the data link compression for the previously filtered protocol data unit is selected; and

otherwise the state of data link compression is selected based on the determined type of data of the given protocol data unit; and

associating the selected state of data link compression with the protocol data unit to control a compression process adapted to compress contents of protocol data units.

29. (Currently Amended) In a data communication network supporting data compression, a method for optimizing compression efficiency, comprising:

without changes to a subordinate protocol layer or changes to the higher protocol layers carried by a given protocol data unit, selectively controlling the state of a compression algorithm based on a protocol-specific header and control

Applicant: Brooks et al.

Application No.: 09/774,545

information of the given protocol data unit or a compressibility determination of a

protocol data unit associated with the given protocol data unit to determine

compressibility for compressing data transported by protocol data unit across a

connection in the data communication network to optimize the compression

efficiency such that if a compressibility determination of a protocol data unit

associated with the given protocol data unit is provided, the same compressibility

determination is made for the given protocol data and if a compressibility

determination of a protocol data unit associated with the given protocol data unit is

not provided, the compressibility determination is made for the given protocol data

based on the protocol-specific header and control information.

30. (Original) The method as claimed in claim 29, wherein selectively

controlling the state of the compression algorithm enables or disables the

compression algorithm.

31. (Original) The method as claimed in claim 29, wherein selectively

controlling the state of the compression algorithm includes analyzing protocol-

specific header and control information of the protocol data units of the higher

protocol layers.

32. (new) The method of claim 1 wherein:

the filtering protocol-specific header and control information of a protocol

- 11 -

data unit (PDU) to determine compressibility of the contents of said protocol data unit includes determining the type of data of the given protocol data unit where the given protocol data unit is not associated with a previously filtered protocol data unit; and

the selecting the state of data link compression for said protocol data unit to optimize compression efficiency is performed such that the state of data link compression is selected based on the determined type of data of the given protocol data unit if the given protocol data unit is not associated with a previously filtered protocol data unit.
